What the Program Does

This lab builds a simple loan eligibility program using three Java classes: **Person**, **Loan**, and **Main**. The program stores a person's information (name, annual income, SSN, and credit score), then checks whether the person qualifies for a loan based on the eligibility rules provided in the lab instructions.

Contributions

- **Omar** — Created the **Person** class, added the required attributes (name, income, SSN, credit score), and implemented all getters and setters to set and retrieve values.
- **Mason** — Created the **Loan** class and implemented the **HomeLoan** and **CarLoan** methods that check eligibility based on income and credit score rules.
- **Zac** — Created the **Main** class, handled user input (collecting person info and selecting loan type), connected the **Person** and **Loan** classes together, and printed the final eligibility result.

Collaboration Notes

We split the work by class (Person / Loan / Main) and then tested the full program together using different income and credit score inputs to confirm the output correctly displays eligible or not eligible.
